STAMARIL

Powder and solvent for suspension for injection in prefilled syringe

YELLOW FEVER VACCINE (LIVE)

Read all of this leaflet carefully before you or your child are vaccinated because it contains important information for you.

- Keep this leaflet. You may need to read it again.
- If you have any further questions, ask your doctor or pharmacist or nurse.
- This vaccine has been prescribed for you or your child only. Do not pass it on to others.
- If you get any side effects talk to your doctor, pharmacist or nurse. This includes any possible side effects not listed in this leaflet. See section 4.

What is in this leaflet:
1. What STAMARIL, powder and solvent for suspension for injection in pre-filled syringe is and what it is used for
2. What you need to know before you use STAMARIL, powder and solvent for suspension for injection in pre-filled syringe
3. How to use STAMARIL, powder and solvent for suspension for injection in pre-filled syringe
4. Possible side effects
5. How to store STAMARIL, powder and solvent for suspension for injection in pre-filled syringe
6. Further information.

1. WHAT STAMARIL, powder and solvent for suspension for injection in pre-filled syringe IS AND WHAT IT IS USED FOR
STAMARIL is a vaccine that provides protection against a serious infectious disease called yellow fever. Yellow fever occurs in certain areas of the world and is spread to man through the bites of infected mosquitoes.

STAMARIL is given to people who:
• are travelling to, passing through or living in an area where yellow fever occurs,
• are travelling to any country that requires an International Certificate of Vaccination for entry (this may depend on the countries previously visited during the same trip),
• may handle infectious materials such as laboratory workers.

To obtain a vaccination certificate against yellow fever it is necessary to be vaccinated in an approved vaccination centre so that an International Certificate of Vaccination can be issued. This certificate is valid from 10 days after the first dose of vaccine. When a booster is needed, the certificate (see Section 3) is valid immediately after the injection.

2. WHAT YOU NEED TO KNOW BEFORE YOU OR YOUR CHILD USE STAMARIL, powder and solvent for suspension for injection in pre-filled syringe

It is important to tell your doctor or nurse if any of the points below apply to you or your child. If there is anything you do not understand, ask your doctor or nurse to explain.

Do not use STAMARIL if you or your child:
• are allergic to:
  - the active substance, or
  - any of the other ingredients of this vaccine (listed in Section 6), or
  - eggs or chicken proteins
• have experienced a severe allergic reaction after an injection of a yellow fever vaccine,
• is less than 6 months old,
• have a poor or weakened immune system for any reason, such as illness or medical treatments (for example corticoids or chemotherapy),
• have a weakened immune system due to HIV infection. Your doctor will tell you if you can still receive STAMARIL based on the results of your blood tests,
• are infected with HIV and have active symptoms due to the infection,
• have a history of problems with your thymus gland or have had your thymus gland removed for any reason,
• have an illness with a high or moderate temperature or an acute illness. The vaccination will be postponed until you have recovered.
Warnings and precautions

Talk to your doctor, pharmacist or nurse before using STAMARIL.

- If you are over 60 years old or if your child is less than 9 months as you have an increased risk of certain types of severe but rare reactions to vaccines (including serious reactions that affect the brain and nerves, as well as vital organs, See section 4). You will only be given the vaccine if the risk of infection with the virus is well established in countries where you are going to stay,

- If your child is aged 6 to 9 months. STAMARIL may be given to children aged between 6 and 9 months only in special situations and on the basis of current official advice.

- If you or your child are infected with the HIV but do not have active symptoms due to the infection. Your doctor will advise if STAMARIL can be given based on the results of laboratory tests and specialist advice.

- If your child is infected with the HIV (AIDS). The doctor may need to perform specific exams and seek advice from a specialist before telling you whether your child may receive STAMARIL.

- If you or your child have bleeding disorders (such as haemophilia or a low level of platelets) or are taking medicines that reduce blood circulation. You can still receive STAMARIL provided that it is injected under the skin and not into a muscle (see section 3).

As with all vaccines, STAMARIL may not fully protect all persons who are vaccinated.

Fainting can occur following, or even before, any needle injection. Therefore tell your doctor or nurse if you or your child fainted with a previous injection.

Other medicines and STAMARIL

Tell your doctor or pharmacist if you are taking, have recently taken or might take any other medicines.

If you have recently had any treatment or medicine which may have weakened your immune system, the vaccination must be delayed until your laboratory results show that your immune system has recovered.

Your doctor will advise you when it is safe for you to be vaccinated.

STAMARIL can be given at the same time as a measles vaccine or vaccines against typhoid fever (those containing the Vi capsular polysaccharide) and/or hepatitis A.

Vaccination with STAMARIL may lead to false positive results of blood tests for dengue or Japanese encephalitis. If you or your child have in the future such tests prescribed, please inform your doctor about this vaccination.

Pregnancy and breast-feeding
If you are pregnant or breast-feeding, think you may be pregnant or are planning to have a baby, ask your doctor or pharmacist for advice before being vaccinated.

You should not receive STAMARIL unless this cannot be avoided. Your doctor or pharmacist can advise you on whether it is essential that you are vaccinated while pregnant or breast-feeding.

Important information about some of the ingredients of STAMARIL:

STAMARIL contains a small amount of sorbitol. The vaccine should not be given to people who have fructose intolerance.

3. HOW TO USE STAMARIL, powder and solvent for suspension for injection in pre-filled syringe

STAMARIL is given as an injection by a doctor or nurse. It is usually injected just underneath the skin but it can be given into a muscle if that is in the applicable official recommendation for the country in which you live.

It must not be injected into a blood vessel.

Posology

STAMARIL is given as a single, 0.5 millilitre dose to adults and children from 6 months of age.

The first dose should be given at least 10 days before being at risk of infection with yellow fever, because it takes 10 days for the first dose of vaccine to work and provide good protection against the yellow fever virus. The protection provided by this dose is expected to last at least 10 years and may be life-long.

A booster with one dose (0.5 millilitre) may be needed:

- if you or your child had an insufficient response to the first dose,
- or after at least 10 years if it is required as a condition of entry in some countries.

How STAMARIL is given

STAMARIL is given as an injection by a doctor or nurse. It is usually injected just underneath the skin but it can be given into a muscle.

It must not be injected into a blood vessel.

If you or your child use more STAMARIL than you should:

In some cases, more that the recommended dose was used.

In these cases, when side effects were reported, the information was in line with what is described in Section 4.

If you have any further questions on the use of this vaccine, ask your doctor, pharmacist or nurse.
4. POSSIBLE SIDE EFFECTS

Like all medicines, this vaccine can cause side effects, although not everybody gets them.

Serious side effects

The following serious side effects have sometimes been reported:

Allergic reactions:

- Rash, itching or hives on the skin.
- Swelling of the face, lips, tongue or other parts of the body.
- Difficulty swallowing or breathing.
- Loss of consciousness.

Reactions affecting the brain and nerves:

These may occur within one month of the vaccination and have sometimes been fatal. Symptoms include:

- High fever with headache and confusion.
- Extreme tiredness.
- Stiff neck.
- Inflammation of brain and nerve tissues.
- Fits.
- Loss of movement or feeling in part or all of the body (Guillain-Barré Syndrome or Focal neurological deficit).

Serious reaction affecting vital organs:

This may occur within 10 days of the vaccination and may have a fatal outcome. The reaction can resemble an infection with the yellow fever virus. It generally begins with feeling tired, fever, headache, muscle pain and sometimes low blood pressure. It may then go on to a severe muscle and liver disorders, drops in number of some types of blood cells resulting in unusual bruising or bleeding and increased risk of infections, and loss of normal functioning of the kidneys and lungs.

If you experience ANY of the above symptoms contact your doctor IMMEDIATELY.

Other side effects

Very common side effects (may affect more than 1 in 10 people):

- Headache.
- Mild or moderate tiredness or weakness (asthenia).
Pain or discomfort at the injection site.
Muscle pains.
Fever (in children).
Vomiting (in children).

Common side effects (may affect up to 1 in 10 people):
- Fever (in adults).
- Vomiting (in adults).
- Painful joints.
- Nausea.
- Reactions at the injection site: redness, bruising, swelling or appearance of a hard lump.
- Uncommon side effects (may affect up to 1 in 100 people): Dizziness.
- Stomach pains.
- A pimple (papule) at the injection site.

Rare (may affect up to 1 in 1,000 people):
- Diarrhea.
- Runny, blocked or itchy nose (rhinitis).
- Not known (frequency cannot be estimated from the available data): Swollen glands (lymphadenopathy).
- Numbness or pins and needles sensation (paresthesia).
- Flu-like illness.

Additional side effects in children

Very common (may affect up to 1 in 10 people):
- Irritability, crying.
- Appetite loss.
- Drowsiness.

These side effects usually occurred within the 3 days following vaccination and last usually not more than 3 days. Most of these side effects were of mild intensity.

Reporting of side effects
If you get any side effects, talk to your doctor, pharmacist or nurse. This includes any possible side effects not listed in this leaflet. By reporting side effects, you can help provide more information on the safety of this medicine.

5. HOW TO STORE STAMARIL, powder and solvent for suspension for injection in pre-filled syringe

Keep out of the sight and reach of children.

Do not use this vaccine after the expiry date which is stated on the carton after EXP.

The expiry date refers to the last day of that month.

Store in a refrigerator (2°C - 8°C). Do not freeze.

Keep the vial of powder and the syringe of the solvent in the outer carton in order to protect from light.

Use immediately after reconstitution.

Do not throw away any medicines via wastewater or household waste. Ask your pharmacist how to throw away medicines you no longer use. These measures will help protect the environment.

6. FURTHER INFORMATION

What STAMARIL contains

After reconstitution, for one dose (0.5 ml):

- The active substance is:

  Yellow fever virus\(^1\), 17D-204 strain (live, attenuated) ...................... not less than 1000 IU

\(^1\) produced in specified pathogen-free chick embryos

- The other ingredients are:

Lactose, sorbitol, L-Histidine hydrochloride, L-Alanine, sodium chloride, potassium chloride, disodium phosphate dihydrate, potassium dihydrogen phosphate, calcium chloride, magnesium sulphate and water for injections.

What STAMARIL looks like and contents of the pack

STAMARIL is presented as a powder and solvent for suspension for injection (powder in a vial (0.5 ml dose) + solvent in a pre-filled syringe (0.5 ml dose) with or without needle). Pack size of 1, 10 or 20.

After reconstitution the suspension is beige to pink beige, more or less opalescent.

Not all pack sizes or presentations may be marketed.

Marketing Authorization Holder

SANOFI PASTEUR SA

2, AVENUE PONT PASTEUR - 69007 LYON - FRANCE
This leaflet was last revised in 04/2016.

The following information is intended for healthcare professionals only:

Instruction for reconstitution:

Before use, the beige to orange beige powder is mixed with the clear colourless sodium chloride solvent provided in a syringe to make a beige to pink beige suspension, which is more or less opalescent.

For syringes without attached needle only: after removing the syringe tip cap, a needle should be firmly placed on the tip of the syringe and secured by rotating a quarter of a turn (90°).

The powder is reconstituted by adding the solvent provided in the pre-filled syringe to the vial. The vial is shaken and, after complete dissolution, the suspension obtained is withdrawn into this same syringe for injection.

Contact with disinfectants is to be avoided so as not to inactivate the virus.

Use immediately after reconstitution.

Before administration, the reconstituted vaccine should be vigorously shaken.

Any unused medicinal product or waste material should be disposed of, preferably by heat inactivation or incineration, in accordance with local requirements.

See also Section 3. HOW TO USE STAMARIL, powder and solvent for suspension for injection in pre-filled syringe.
